

Are you in search of a business information risk management tool? Your wait is over as ACPL System has launched its new IT security product DLP. However, DLP is not another Firewall or Anti-virus which can work quickly and produce the results. DLP mainly works to ensure that any sensitive or critical information is monitored properly and in some cases is also prohibited from leaving the business and go to wrong hands. The only challenge faced while deploying DLP in customer space is that it has been understood as a pure play IT security product. This is not the actual scenario, though. DLP has to figure out what information is existing and amount of the sensitivity of the data to get significant policies. You cannot achieve this with the template based policy only. Deploying the DLP technology is easy and ACPL will help you in every respect. The only thing you need to do is plot it to the taxonomy in the proper place in order to avail the maximum benefit of the technology as well as a prompt ROI. DLP policy itself will provide you with an overview of what else is needed to keep the data secure once you have created the data flow map. Last but not the least the main SI in the DLP domain is ACPL which will provide you an end to end DLP framework as well as management tips and technology.
